CHANGING WATERWAYS

Stuart Strum

Water Resources Planner

Los Angeles District

PRESENTATION OUTLINE

California Climate and Waterways

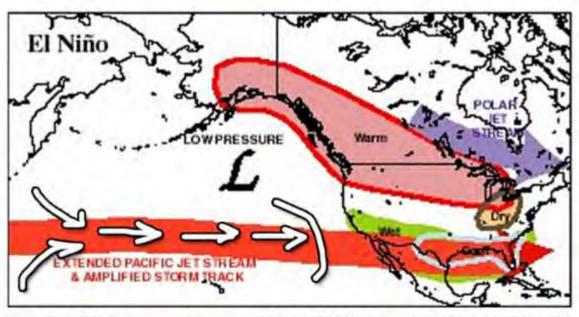

- Drought
- Floods

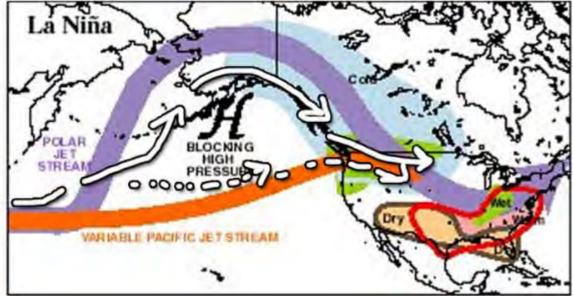

Water Infrastructure – Water Storage and Transfer Urban Drainage – Patterns of Development

CLIMATE: EL NINO- SOUTHERN OSCILLATION

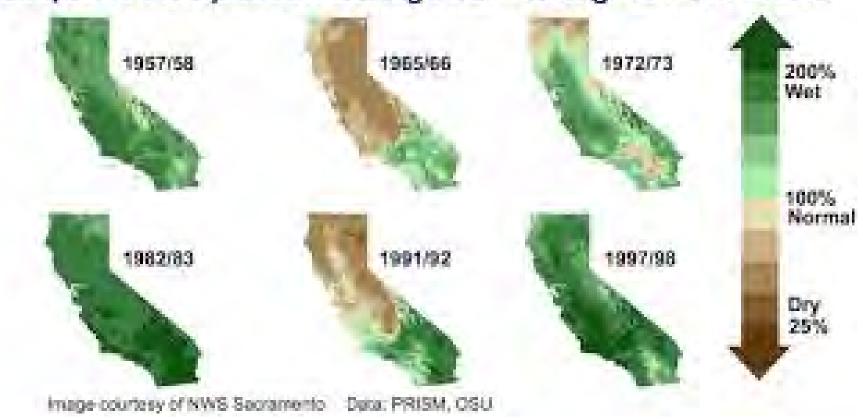

HISTORIC RECORD OF EL NINO

California Precipitation During Prior "Strong" El Niño Events

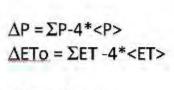

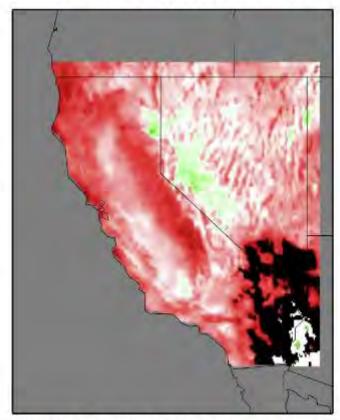

EXTREME EVENTS: MULTI-YEAR DROUGHT

NET PRECIPITATION CONTRIBUTION TO DROUGHT WY2012-2015

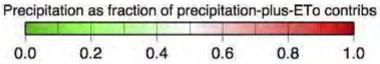

Plotted here:

 $-\Delta P/(\Delta P - \Delta ETo)$

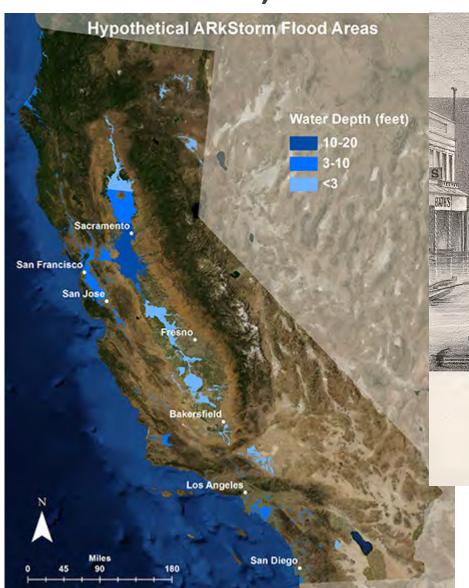

EXTREME EVENTS: ARKSTORM (HISTORICAL PRECEDENT 1862)

K, STREET, FROM THE LEVEE.

INUNDATION OF THE STATE CAPITOL,

City of Sacramento, 1862.

CALIFORNIA WATER SYSTEM AND COLORADO RIVER

WATER STORAGE AND DISTRIBUTION IN CALIFORNIA

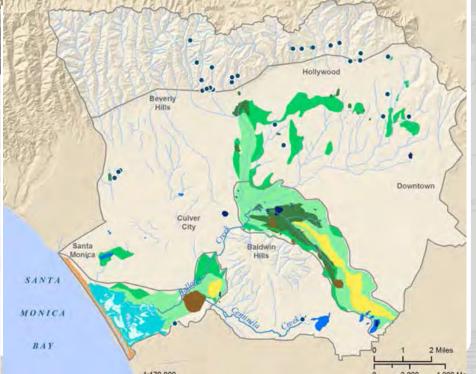

LOS ANGELES RIVER URBAN DRAINAGE

HISTORICAL AND RECENT FLOODING

2018

Debris Flows Likely Across Recent Burn Areas Tue-Thu

ACROSS RECENT BURN AREAST

- Thomas, Creek, and LaTuna Burn Areas-Mod-high risk of debris flows
- 5-10" rain expected for foothills & Mtns with high hourly rainfall rates
- Flash flooding also possible outside burn areas due to sustained heavy rainfall
- Stay alert to the forecast and listen to your local emergency managers

Debris Flow:

Dangerous land and water flow caused by heavy rainfall, terrain, and loose-bare soil.

FLOOD IMPACTS – NOT JUST WATER

- Landslides and debris flows can cause extensive damage
- Many streams do not have stable banks without engineering control, and bank failure during flood events can damage property and pose a safety hazard
- Factors affecting bank stability
 - Steep slopes and fault-controlled uplift
 - Loose sediment and poorly consolidated formations in stream banks
 - Sudden, high stream flows in flood events
 - Bed load dominated sediment transport

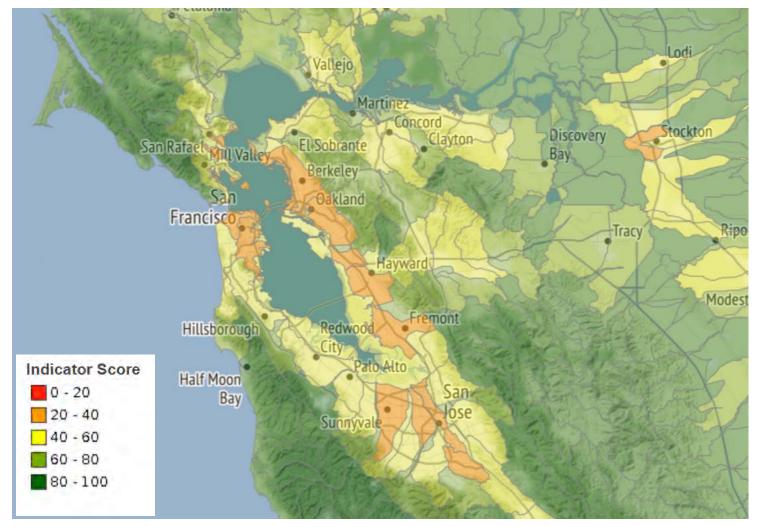

UC DAVIS STREAM WATER SUSTAINABILITY INDICATORS – GEOMORPHIC CONDITIONS

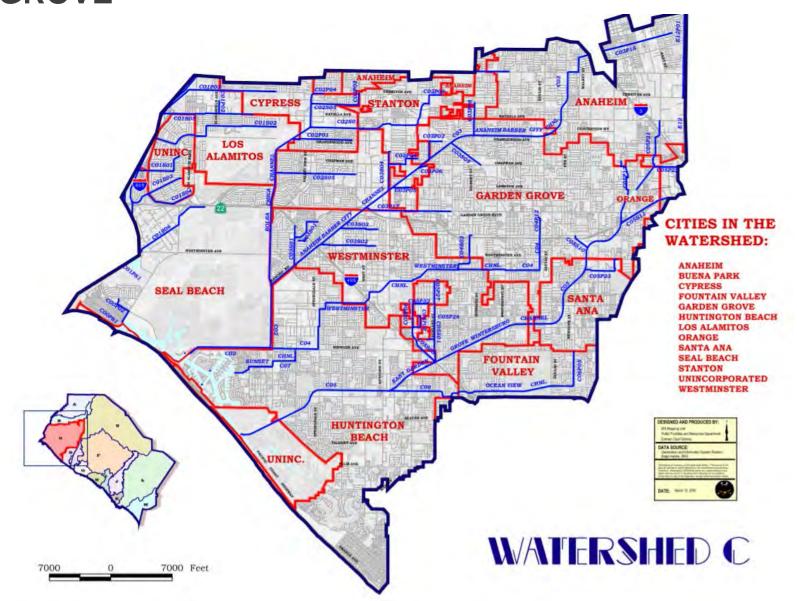

UC DAVIS STREAM WATER SUSTAINABILITY INDICATORS – GEOMORPHIC CONDITIONS

ORANGE COUNTY: WESTMINSTER—EAST GARDEN GROVE

WESTMINSTER—EAST GARDEN GROVE SCENARIO

Pre-Development: Coastal Plain with areas of poor drainage

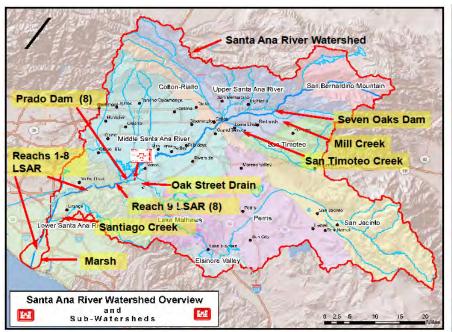

Initial Settlement and Agricultural Development: Drainage Districts established to improve drainage, support irrigation. Drainage/irrigation canals constructed, extensive agriculture Urbanization and Residential Development: Flood control Districts expand existing drainage ditches, typical flood protection at 25-year recurrence interval

Ongoing system upgrades: improve flood protection with fully engineered channels, goal: 100-year recurrence interval

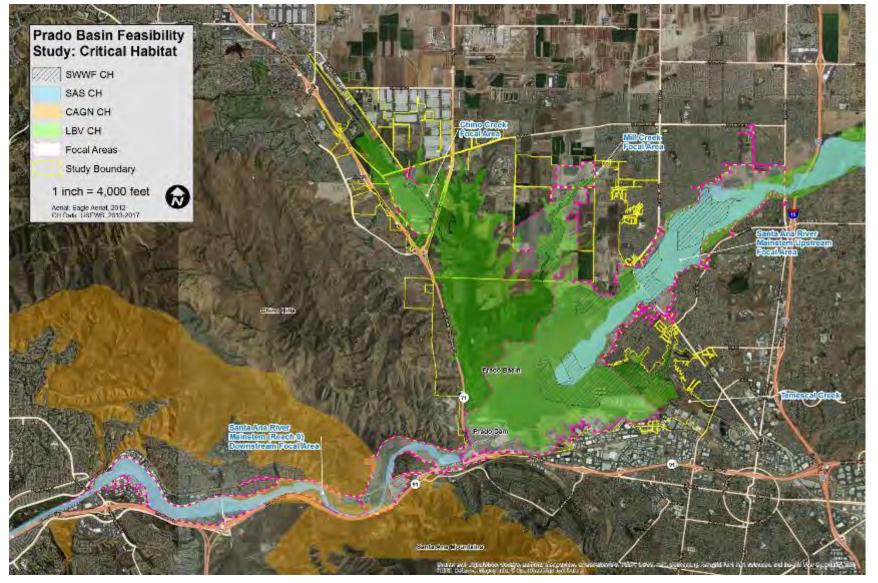

Santa Ana River Projects

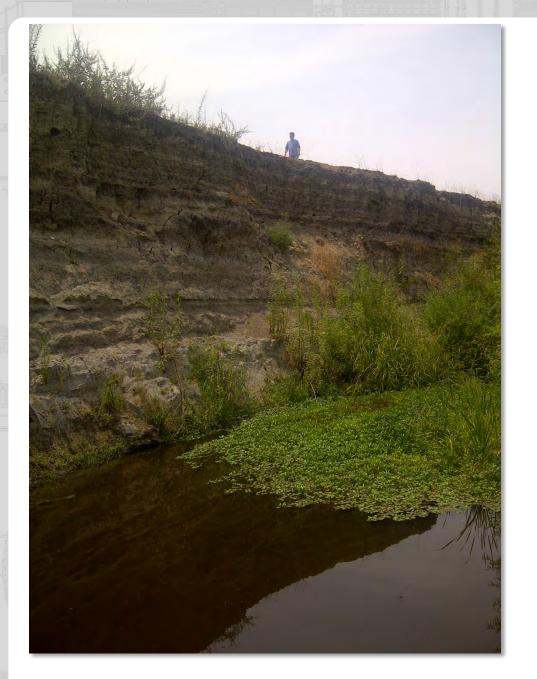

RESOURCE SIGNIFICANCE: Threatened and Endangered Species Critical Habitats

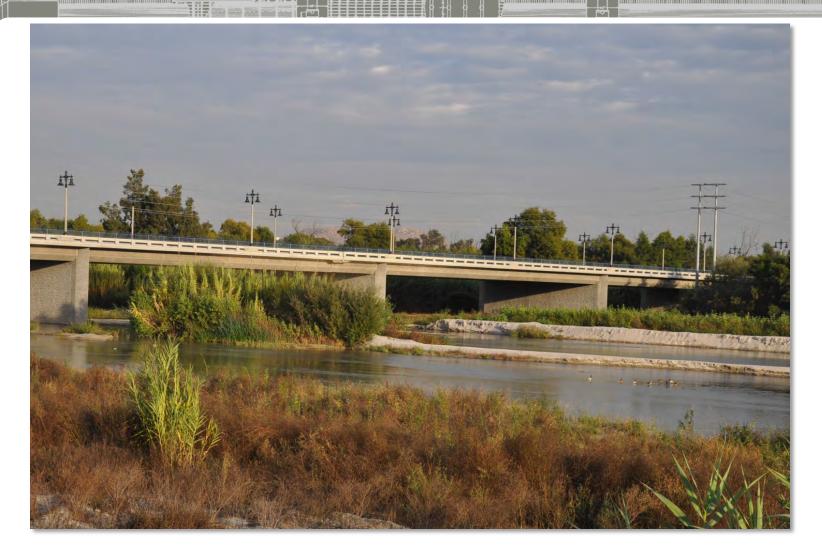

Problem: Incised Channels

- Sediment starved flows scour streambeds and streambanks
- •Steep sides degrade habitat by reducing the area available for native vegetation and by reducing connectivity
- •Incised channel lowers water table beneath the floodplain and reduces floodplain wetlands

Problem: Upstream Sedimentation

Problem: Non Native & Highly Invasive Arundo Donax

- Displaces native vegetation
- Consumes 9-25 acre-feet of water/acre/year (2-4 times more than native vegetation)

US Army Corps of Engineers

PROBLEM: NON-NATIVE WILDLIFE

FERAL PIGS, COWBIRDS, CRAWDADS, TURTLES

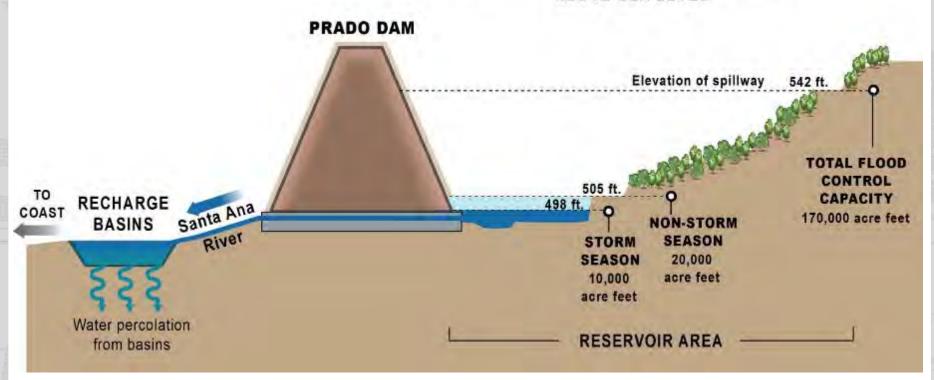

PRADO DAM OPERATIONS AND WATER CONSERVATION

WATER CONSERVATION ELEVATIONS

ABOVE SEA LEVEL

PRADO BASIN RESTORATION TECHNIQUES

- Sediment Management upstream removal and downstream re-entrainment
- Invasive Vegetation Management
- Invasive Animal Control
- In-stream habitat features rock groins for mimicking natural flow conditions and habitat
- Channel restoration channel diversion, bank features and reconnection to floodplain

CHANGING WATERWAYS – SUMMARY

- California's climate is inherently conducive to flooding and droughts
- Water supplies are dependent on large-scale longdistance transfers
- Development has incrementally addressed flood risks
- California's terrain means flooding has additional impacts beyond inundation (bank failure, landslides)
- Restoration opportunities do exist
- Greatest limitations on restoration and adaptation are posed by extensive development
